

Dear REWORK Digital team,

Your posting asks for examples of automation systems with results — so here are three, with numbers:

Lead qualification agent (Claude AI + n8n + Airtable): scores, routes, and syncs inbound leads to the CRM autonomously — cut response times 30–60% in production. **Document and reporting automation** (n8n + Zapier): eliminated recurring manual work, saving client teams 10–25+ hours weekly. **Operations dashboard** (Airtable + Zapier + n8n): automated reporting with triggers and validation — reduced follow-up overhead 40%.

The pattern behind all three is the one your posting describes: map the process, automate the repeatable core, optimize with real usage data, then scale it across teams. I've run that loop for four years for SaaS and service-based SMBs, working across Zapier, Make, n8n, HubSpot, Salesforce, and Zoho, with JavaScript scripting where visual tools run out.

A part-time, defined-term engagement suits how I work — I'm a remote contractor used to delivering in clear scopes with documentation that outlives my involvement. I'm based in WAT (GMT+1), overlap comfortably with North American mornings, and can start July 1.

Happy to record a short Loom walking through any of these systems — the fastest way to judge automation work is to watch it run.
