

Dear Patrick,

Shipping a public API one month after launching Vids AI told me more about this role than the job post did: the raw material for an AI-native Vidalytics already exists — it needs someone to wire it into the work your revenue teams do every day.

That end-to-end wiring is what I do. At Manny Hall and Associate I built an AI lead-qualification agent — Claude scoring leads from structured Airtable and CRM data, n8n orchestrating routing and CRM updates — that cut response times 30–60%. Recurring document and reporting automations I shipped save client teams 10–25 hours a week. Not chatbots that talk; systems that finish work. In a bootstrapped company, that's the equivalent of fractional hires your P&L never has to carry.

One honest note: my retrieval-grounding experience is structured-data grounding (Airtable/CRM feeding Claude), not vector-store RAG. The orchestration, prompt-engineering, and integration patterns are the same, and closing that specific gap would be my first self-assigned project — I'd rather flag it now than have you find it later.

If it's useful, I'll sketch on one page how I'd pipe your API's engagement data into HubSpot health scores and churn-save plays. Either way, I'd welcome the job simulation — my systems hold up to inspection.
